

Galaxy System Api Document

Version: 3.0.5

Date: 2025/04/29

Changes: Revise maya business withdrawl parameters

Overview

Merchant ID: The unique identification account registered by the merchant on the Galaxy platform.

Amount: All amounts in the text are in dollar, including two decimal places unless otherwise specified.

interface list:

	Interface name	Interface description
1	Payment interface	Transaction interface between the merchant and the Galaxy system
2	Single transaction query interface	Single transaction query interface between the merchant and the Galaxy system
3	Payment result notification interface	The payment result notification interface between the merchant and the Galaxy system (server asynchronous notification interface).

MD5 Signature Algorithm for API Requests

To ensure the security of API requests, the signature algorithm must be followed. Please note that the data should be sorted in ASCII ascending order according to the key-value pairs in the format of `k1=v1&k2=v2`. After sorting, please concatenate the string with `key=your_secret_key` at the end. Finally, the concatenated string needs to be encrypted using the MD5 algorithm, and the resulting hash should be sent to the website in the `sign` parameter.

Example:

Suppose we have the following key-value pairs:

`k1=123`

`k3=456`

`k2=abc`

After sorting in ASCII ascending order, we get the following string:

`k1=123&k2=abc&k3=456`

Then we concatenate the string with the secret key, let's say it is "`my_secret_key`":

`k1=123&k2=abc&k3=456&key=my_secret_key`

Next, we apply the MD5 algorithm to the concatenated string and obtain the resulting hash, which will be sent in the `sign` parameter:

`sign=MD5(k1=123&k2=abc&k3=456&key=my_secret_key)`

Payment Deposit interface

The payment transaction interface between the merchant and the Galaxy. The merchant is required to submit transaction order data to the Galaxy API payment website in accordance with the interface specifications, using **HTTPS POST** to submit the data.

Interface Parameter Definition

1. Transaction request address: **https://[domain name]/api/transfer**
2. The encoding in the request parameters is limited to **UTF-8**
3. The payment request parameters are defined as follows:

parameter	type	Required	illustrate
merchant	String	Required	The unique merchant number assigned by the payment platform when the merchant signs a contract.
payment_type	String	Required	Accepted values and descriptions: 1=Qrcode, 2=WEB_H5, 3=Fast Direct, 7=Original channel
amount	Number	Required	The requested amount to pay
order_id	String	Required	Order number in merchant system
bank_code	String	Required	Gcash => gcash ; Paymaya=>PMP ; Gotyme=>GOT MayaPHQR=>mya;
callback_url	String	Required	The address that members will be notified of when payment is successful.
return_url	String	Required	Jump address after successful direct connection channel.
sign	String	Required	MD5 signature result, please refer to the signature algorithm of the payment result notification interface.

Return parameter

The return value is in JSON format.

parameter	parameter name	type	illustrate
status	processing code	String	1 indicates successful verification, and other error codes are 0.
message	return message	String	Return "success" upon successful payment request, or returnerror information upon errors.
order_id	order number	Number	your order number
amount	Payment amount	Number	payment amount
redirect_url	Payment address	String	Payment page
qrcode_url	Payment address 2	String	【 Same as above 】 Payment page
gcash_qr_url	Payment address 2	String	Maya business packaged as gcash cashier

QR payment interface-Return to the QR image

(The deposit page needs to be decorated by yourself)

The payment transaction interface between the merchant and the Galaxy. The merchant is required to submit transaction order data to the Galaxy API payment website in accordance with the interface specifications, using **HTTPS POST** to submit the data.

Interface Parameter Definition

- 1. Transaction request address: **https://[domain name]/api/transfer**
- 2. The encoding in the request parameters is limited to **UTF-8**
- 3. The payment request parameters are defined as follows:

parameter	type	Required	illustrate
merchant	String	Required	The merchant number assigned by the payment platform when the merchant signs a contract.
payment_type	String	Required	Accepted values and descriptions: 1= QR code
amount	Number	Required	The requested amount to pay
order_id	String	Required	Order number
bank_code	String	Required	Fixed value gcash
customer_bank_card_account	String	Required	Gcash account used by members for payment
callback_url	String	Required	The address that members will be notified of when payment is successful.
return_url	String	Required	Jump address after successful direct connection channel.
sign	String	Required	MD5 signature result, please refer to the signature algorithm of the payment result notification interface.

Return parameter

The return value is in JSON format.

parameter	parameter name	type	illustrate
status	processing code	String	1 indicates successful verification, and other error codes are 0.
message	Return information	String	If the payment request is successful, success will be returned, and if it is an error, error information will be returned.
order_id	order number	Number	The order number sent by the merchant.
amount	Payment amount	Number	Payment amount, with two decimal places.
merchant_bank_card_account	Deposit account number	String	Deposit account number
redirect_url	Payment address	String	Payment page
qrcode_url	Payment address 2	String	【 Same as above 】 Payment page
gcashqr	Pay for pictures	String	The data format is base64

Single transaction query interface (Deposit and withdrawl are the same)

Single transaction query interface between the merchant and the Galaxy system

1. Transaction request address: [https://\[domain name\]/api/query](https://[domain name]/api/query)
2. The query request parameters are defined as follows:

parameter	type	use	illustrate
merchant	String	Required	The merchant number assigned by the payment platform when the merchant signs a contract.
order_id	String	Required	The order number provided by the merchant.
sign	String	Required	MD5 signature result, please refer to the signature algorithm of the payment result notification interface

Return parameter

The return value is in JSON format.

parameter	type	illustrate
order_id	Number	Order number
amount	Number	Payment amount, with two decimal places.
status	Number	Transaction status: 0-error 1-waiting 2,6,10-in progress 3-failed 5-success.
message	String	Message from payment.

Balance query interface

Transaction request URL: [https://\[domain\]/api/me](https://[domain]/api/me)

parameter	type	use	illustrate
merchant	String	Required	The merchant number assigned by the payment platform when the merchant signs a contract.
sign	String	Required	MD5 signature result, please refer to the signature algorithm of the payment result notification interface.

Return parameter

parameter	type	illustrate
merchant	String	Merchant id
merchant_display_name	String	The merchant order number sent by the payment request, or empty if none.
balance	Float	Merchant balance
pending_balance	Float	Amount of pending order
Sign	MD5(32)	MD5 signature result.

Receipt query interface

Transaction request address: [https://\[domain name\]/api/receipt](https://[domain name]/api/receipt)

parameter	type	use	illustrate
merchant	String	Required	The merchant number assigned by the payment platform when the merchant signs a contract.
order_id	String	Required	Order number provided by the merchant °
sign	String	Required	MD5 signature result, please refer to the signature algorithm of the payment result notification interface.

Return parameter

parameter	type	illustrate
status	String	1 for success, 0 for failure
message	String	When the request is successful, it is success, if it fails, it is an error message.
receipt	String	receipt URL

Payment Result Notification Interface - Callback Interface (Shared by Withdraw and Deposit)

According to the callback_url parameter submitted in the payment interface, after the payment is completed, the payment platform will send relevant payment and user information to that URL. The notification frequency is once per minute, up to 10 times, but it cannot be guaranteed that the notification will eventually be successful. If there is any abnormality in the payment result, the notification will be re-initiated. The data will be transmitted via HTTPS POST in the MultiPart/FormData format.

- Please return **SUCCESS** after successfully receiving the notification, otherwise it will be notified 5 times.

parameter	illustrate
merchant	The merchant number assigned by the payment platform when the merchant signs a contract.
order_id	Order number
amount	Pay the requested amount.
status	Payout results: 5=success ; 3 =failure.
message	Payment result: 成功 、拒绝.
remark	[* Default off] · It is enabled by the merchant notification platform. After it is enabled, the reason for failure or the receipt number will be sent.
sign	MD5 signature result.

For example

```
{"order_id":"dsfsdfsdf1608044474","amount":100.00,"merchant":"merchant","message":"\u6210\u529f","status":5,"sign":"97e06225375f75d0ba88c12207035a34"}
```

Withdrawl interface

The payment transaction interface between the merchant and the Galaxy. The merchant is required to submit transaction order data to the Galaxy API payment website in accordance with the interface specifications, using **HTTPS POST** to submit the data.

Interface Parameter Definition

- 1. Transaction request address: **https://[domain name]/api/daifu**
- 2. The encoding in the request parameters is limited to **UTF-8**
- 3. The payment request parameters are defined as follows:

parameter	type	Required	illustrate
merchant	String	Required	The merchant id assigned by the payment platform when the merchant signs a contract.
total_amount	Number	Required	The amount to pay
callback_url	String	Required	The address to notify the merchant the result.
order_id	String	Required	Order number in merchant system
bank	String	Required	The bank which the member receives payment
bank_card_name	String	Required	The Gcash number or the name of member if it withdrawl to the bank
bank_card_account	Number	Required	The Gcash number or the bank account
bank_card_remark	String	Required	IFSC,If not,Enter the gcash number or Maya business phone number, Or just fill in "no"
sign	String	Required	MD5 signature result, please refer to the signature algorithm of the payment result notification interface.

Return parameter

The return value is in JSON format.

parameter	type	illustrate
status	String	A value of 1 indicates successful verification, and other error codes are 0.
message	String	If the payment request is successful, success will be returned, and if it is an error, error information will be returned.
